

iManage Connector for MCP

One connection. Any AI. Full governance.

As legal organizations race to adopt AI, many AI solutions require custom integrations to connect securely to content and address multi-vendor complexity and governance. iManage Connector for MCP (Model Context Protocol) addresses this through a standardized, open-protocol connection between iManage and any AI system. Whether your organization uses Copilot, Harvey, Legora, ChatGPT, Claude, or builds its own agents, MCP provides permission-bound, auditable access to iManage content **without removing it from the governed platform**.

Key features and benefits

Standardized AI connectivity: A single MCP connection replaces multiple custom API integrations. Any compliant AI system connects once configured, allowing firms to add or switch tools without new IT projects or vendor lock-in.

Content stays in place: AI systems access iManage content where it lives, with nothing extracted or copied to third-party data stores, reducing shadow IT risks and meeting legal and compliance requirements.

Governed and auditable access: All AI access to iManage content through MCP is authenticated, permission-bound, and fully logged. Existing ethical walls and access controls are respected natively, giving IT and compliance teams confidence to approve AI adoption.

AI freedom and choice: MCP is an open, vendor-neutral standard. iManage Connector for MCP works across generalist orchestrators (ChatGPT, Claude, Copilot) and legal AI specialists (Harvey, Legora), allowing firms to switch models without reintegration.

Future-proof integration foundation: MCP is an open standard gaining rapid adoption across the AI industry. iManage Connector for MCP positions customers for this industry shift, allowing technology investments to compound over time while decoupling information strategy from AI tool selection.

Context-aware AI performance: iManage Connector for MCP uses client and matter structure to guide AI to the right content. Metadata, classifications, and iManage Security Policy Manager policies are respected, ensuring AI works with properly governed, well-organized knowledge rather than undifferentiated data.

Complements Ask iManage: Ask iManage brings AI natively to governed iManage content with no configuration. MCP securely extends that same governed knowledge to the AI tools customers are already investing in. Many organizations will use both, with iManage as the trusted knowledge foundation.

Choose your AI. Keep your governance.

iManage Connector for MCP gives legal organizations the freedom to use the AI of their choice without compromising the governance, compliance, and security built into iManage. One standardized connection replaces costly custom integrations, keeps content governed and auditable, and enables firms to adopt new AI tools without rebuilding their integration stack.
