

The next-generation iManage platform for in-house legal

iManage unifies documents, emails, knowledge, and AI into a single governed platform, so corporate legal teams can work faster, manage risk, and put AI to work on defensible content.

The pressures corporate legal teams face today

- ✗ **Fragmented information:** Legal work scattered across email, shared drives, and collaboration tools, with no clear source of truth.
- ✗ **No real-time view of the portfolio:** Risk exposure, active negotiations, and emerging issues surface through manual reporting cycles, often after they've already escalated.
- ✗ **Regulatory and recordkeeping pressure:** Data privacy laws, SEC recordkeeping, and compliance mandates create real consequences for poor governance.
- ✗ **Outside counsel spend:** Legal is expected to bring more work in-house and show ROI, yet returned work product disappears into folders instead of becoming reusable knowledge.
- ✗ **AI governance risk:** You can't use AI responsibly on uncontrolled, over-retained content — defensibility requires a governed foundation.
- ✗ **Knowledge that leaves with people:** When senior in-house counsel move on, a decade of judgment about how the company handled its matters walks out the door.

What changes with iManage

- ✓ **See the complete picture of every matter:** Reveal every matter and project in one secure, governed foundation — documents, communications, people, activity, and business context. AI email filing and classification folds every conversation into its matter, so nothing stays lost in an inbox.
- ✓ **Enrich your knowledge:** The iManage context fabric™ classifies and enriches your knowledge, reveals the relationships and connections across it, and layers in real-time activity about what agents and people are doing.
- ✓ **AI that knows your work as well as you do:** Ground legal teams in the context fabric to understand what's happening, inform strategy, and drive next steps, while you stay in control of what AI can see, touch, and do.
- ✓ **Get to AI value faster:** Give every AI the right context to deliver stronger results, in iManage or in a connected tool through the iManage MCP Server, surfacing only what's relevant then writing back work into iManage.
- ✓ **Security and governance built for AI:** Access stays scoped, requests stay audited, and search stays permissioned across tools. Policy-driven retention removes redundant, obsolete, and trivial content, so AI reasons from current, accurate records.
- ✓ **Governance that travels with your knowledge:** Work through governed links, not copies, so every share keeps your audit trail and access controls. When a file does leave, sensitivity labels travel with it through Microsoft Purview.

Key use cases

Daily legal work: Manage email and documents in one governed workspace. Find content instantly with AI-Native Search, powered by Ask iManage, and reuse prior work and templates to respond faster.

Responsible AI adoption: Apply AI only to trusted, governed content. Get insights and accelerate drafting without sacrificing privilege, accuracy, or defensibility.

Find and reuse what the team already knows: Surface precedents, negotiated positions, and templates instantly, so every attorney builds on the team's best work instead of starting from a blank page.

Compare, review, and hold work to standard: Compare a draft against the right prior version with built-in comparison, and hold agreements to your organization's standard with playbooks that flag deviations and missing clauses.

Secure outside counsel and stakeholder management: Share through governed collaboration links, not email, and maintain full visibility and control. Bring returned work product back as reusable institutional knowledge.

What sets iManage apart

#1 Purpose-built for in-house legal: Designed around how corporate legal teams work — managing cross-functional relationships, aligning with enterprise IT, and keeping the organization's most sensitive data secure.

#2 A system of intelligence, not just storage: The iManage context fabric turns your governed work product into an intelligence layer AI can reason over, managing content from creation through defensible disposition with full auditability.

#3 Governance that matches legal reality: Security, permissions, and policies reflect how legal work is structured — organized around matters, projects, and privilege levels.

#4 AI you can defend: AI is grounded in active, governed, appropriately retained content. Transparent, traceable, and accountable, so AI enhances legal judgment rather than introducing new risk.

#5 Trusted by highly regulated organizations: iManage is adopted by organizations with the most demanding requirements for confidentiality, risk management, and compliance, managing millions of sensitive legal documents at scale.

40%+ of the Fortune 100 trust iManage — the established standard where security, governance, and defensibility aren't optional.
